

DL-SDD DATASHEET

SOIL MOISTURE, TEMPERATURE AND SALINITY PROFILE FOR LORAWAN $^{\scriptsize \$}$

FEATURES

LoRaWAN®-enabled soil moisture, temperature and salinity profile sensor.

Very robust probe design.

Subsurface probe measures soil moisture, temperature and salinity at 6 levels of depth: 50, 150, 250, 350, 450, 550 mm depth.

Various probe configurations are available: number of levels, lengths of probe (contact us).

Capacitance-based soil moisture measurement.

Cable length: 5 m.

Compatible with LoRaWAN® networks of any provider.

Place and measure: no setup required.

Configurable via command line interface and downlink command interface.

Unattended real-time monitoring for several years without replacing batteries.

Robust polycarbonate enclosure: weatherproof, impact-, UV-resistant (IP67).

Standard alkaline (C-type) batteries.

CE compliant, Radio Equipment Directive (RED) 2014/53/EU.

APPLICATIONS

Outdoor remote monitoring.

Irrigation control.

Smart agriculture.

Greenhouse and soil-less plantations.

Parks.

Golf courses.

DESCRIPTION

Sensor data are transmitted in real-time using LoRaWAN® radio technology. LoRaWAN® enables encrypted radio transmissions over long distances while consuming very little power. The user can obtain sensor data through Decentlab's data storage and visualization system, or through the user's own infrastructure. Visit www.decentlab.com for more information about Decentlab's data cloud service.

DEVICE VARIANTS

Name	Variant	
DL-SDD-001	600 mm probe length, 6 soil moisture, temperature and salinity sensors	
Other lengths, number of sensors: contact us		

DEVICE SPECIFICATIONS

DEVICE LOGGING FUNCTION

Sampling interval	10 min (configurable through the user interfaces)		
Data upload interval	10 min (configurable through the user interfaces)		
Reported sensor data (average of samples)	Soil moisture, temperature, salinity at depth levels 0 5 Soil moisture, temperature, salinity at depth levels 6 11 (if available, in a separate LoRaWAN packet) Battery voltage		
SD-card logging	Optional		

SOIL MOISTURE

Operating principle	High frequency / capacitance technology		
Measurement range	0 100 % volumetric water content (VWC)		
Resolution	0.01 %		
Precision	±0.03 %		

SOIL TEMPERATURE

Measurement range	-20 60 °C
Accuracy	±2.0 °C at 25 °C

SALINITY

Operating principle	Calculation of volumetric ion content (VIC), a measure of the amount of ionic components in the soil. VIC can be quantitatively related to soil electrical conductivity (EC) through site specific physical soil sampling and analysis.		
Measurement range	0 8000 volumetric ion content (VIC)		
Accuracy	Not specified		

RADIO / WIRELESS

Wireless technology LoRaWAN®
Wireless security AES-128 data encryption

LoRaWAN® device type Class A end-device

Supported LoRaWAN® features OTAA, ABP, ADR, adaptive channel setup

Wireless range > 10 km (line of sight¹), approx. 2 km (suburban)

RF transmit power 14 dBm (25 mW)
Effective radiated power 11.9 dBm maximum²

Receiver sensitivity -146 dBm³

Frequency bands 868 MHz (EU version), 915 MHz (US, AS, AU versions)⁴

Antenna Integrated omnidirectional antenna featuring a near-perfect

radiation pattern²

POWER SUPPLY

Internal battery type	2 × alkaline C batteries (LR14)
Power consumption (average)	≤ 0.95 mW (10 min interval)
Battery lifetime estimation ⁵	4.2 years (10 min interval, SF7) 2.1 years (10 min interval, SF12) 11.8 years (60 min interval, SF7) 8.1 years (60 min interval, SF12)

OPERATING CONDITIONS

Temperature	-20 50 °C
Humidity	0 100 % RH

MECHANICAL SPECIFICATIONS

Enclosure dimensions $135 \times 81 \times 70 \text{ mm}$ (not including sensor / cable)			
Probe dimensions Length: 610 mm approximately, shaft diameter: 30 m			
Cable length	5 m		
Weight	980 g including batteries and sensor (850 g without batteries)		
Material, IP rating	Enclosure: Polycarbonate; weatherproof, impact-, UV-resistant (IP66/IP67); pressure equalizer plug with PTFE membrane (IP68).		

- 1 Decentlab reports successful transmissions over 56 km distance and more
- 2 See Appendix A: Antenna performance
- 3 Specified by radio chip vendor
- 4 Contact us for region specific options
- 5 Including alkaline battery self-discharge of 3.6 % per year (conservative estimation); battery capacity: 20000 mWh.

OPERATING INSTRUCTIONS

The product usually requires no user interaction. If you open the enclosure, e.g. in order to replace the batteries, unscrew the four plastic screws and carefully open the lid.

CAUTION: Make sure the sensor unit does not drop out of the enclosure while opening! Do not touch the electronic components and sensors!

NOTE: When closing the lid, make sure the lid is fitted the right way, so that the enclosure is properly sealed: A little nose in the enclosure fits a notch in the lid and vice versa.

REPLACING BATTERIES

Insert 2 high-quality alkaline C batteries (LR14) into the battery holder on the back side of the sensor unit. The device operates until the battery voltage drops to 2.0 V. Always replace both battery cells with two identical fresh batteries.

USER BUTTON AND LEDS

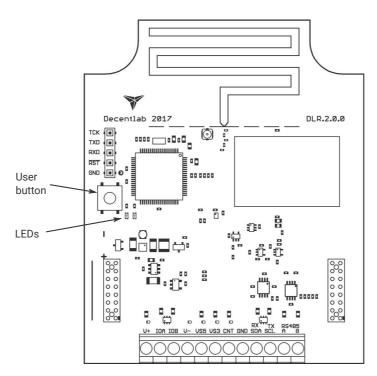

Illustration 1: Sensor unit showing the user button and LEDs. The battery holder is on the back side of the sensor unit.

OPERATING MODES

The device has four operating modes:

- Reset: System (re-)start; both LEDs fade in and out.
- Active mode (ON): Periodic measurements and data transmissions; green LED flashes for each measurement.
- Sleep mode (OFF): No measurements and data transmissions (power save mode, for shelf storage). LEDs are off.
- Test mode: Measurements and data transmissions at fastest possible rates; blue LED is on. NOTE: Use only momentarily, e.g. for testing the sensor or the wireless connection. The device will switch automatically to active mode after 20 minutes.

SWITCHING BETWEEN OPERATING MODES

The user button allows to switch between the operating modes as shown in Illustration 2 and Illustration 3. To perform a device reset, switch to sleep mode first (if necessary) by pushing and holding the button for 3 seconds until the LEDs flash three times; wait 3 seconds; then push and hold the button for 3 seconds until the LEDs fade in and out. To switch between active and test mode, push the button for 1 second (blue LED on / off). If the blue LED is off, the device is in active or sleep mode. If the blue LED is on, the device is in test mode.

HINT: To check whether the device is active or in sleep mode (on or off), push the button twice; if the blue LED goes on and off, the device is in active mode; otherwise, the device is in sleep mode.

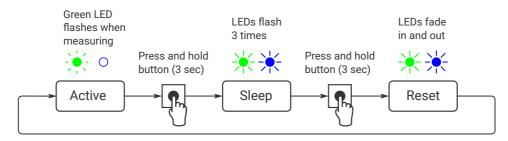

Illustration 2: Switching between active and sleep mode (switch off / on, reset).

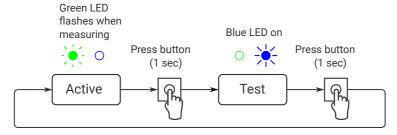

Illustration 3: Switching between active and test mode.

MEASUREMENT CYCLE (ACTIVE MODE)

During the active mode, the device periodically reads the sensors with sampling period T_S = 10 minutes (default, configurable). When the send period T_{TX} = $n \cdot T_S$ (default: n = 1, configurable) has expired, the device computes the average of the collected sensor values (at most 20 values). After a random delay of 0 ... 8 seconds, the device transmits the aggregated sensor data. If the device has not yet joined the LoRaWAN® network, it will try to join until it succeeds (maximum 3 attempts per sampling period). Afterwards, it will transmit the data (TX data). Following the data transmission, two receive slots are opened (RX1 and RX2). During these time slots, the device is ready to receive data from the network (downlink messages) as defined in the LoRaWAN® specification.

As shown in the diagrams, the device is idle most of the time. During the idle time, the current consumption is extremely low.

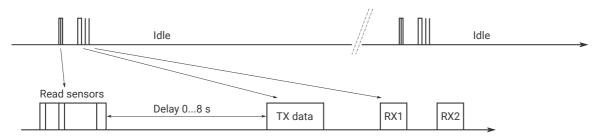

Illustration 4: Device activity during the active mode.

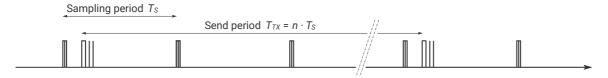

Illustration 5: Sampling period vs. send period. Default: $T_s = 10$ min, $T_{Tx} = 1 \cdot 10$ min = 10 min.

LED SIGNALING (ACTIVE MODE)

- · Read sensors: green LED flashes once.
- Data sent successfully: green LED flashes 2 times.
- Data could not be sent: green LED flashes 4 times.

DEVICE CONFIGURATION

The user can configure a rich set of device parameters, such as sampling interval, LoRaWAN® data rate, ADR settings and many more. If desired, the parameter settings can be stored permanently in the internal non-volatile memory. The user can configure the device via two interfaces:

- Command line interface: via a serial cable (UART USB) connected to a computer.
- Downlink command interface: over the air using LoRaWAN® downlink messages.

For a full description of the command line interface and the downlink command interface, please find the specific documents on www.decentlab.com/support.

MOUNTING INSTRUCTIONS

Prefer a mounting location which is protected against rain and direct sun radiation.

For best radio performance, install the device upright with the cable towards ground; ideally, in such a way that the device lid faces roughly in the direction of the next gateway. Also, the higher above ground, the better. Avoid metallic objects close to the device.

The housing includes 4 threaded bushes (M4) in a 90×60 mm rectangle (see Illustration 6). This enables easy installation using standard M4 bolts.

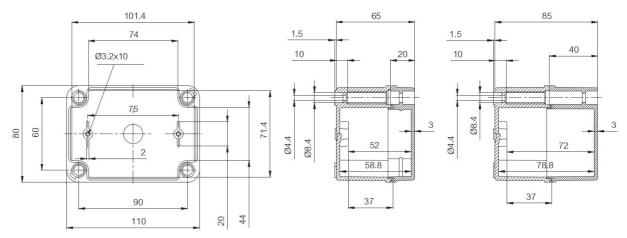

Illustration 6: Housing dimensions (in mm). Note: Drawing not including cable gland and sensor.

ORDERING INFORMATION

REFERENCE	VERSION	REGION (LORAWAN®)

SENSOR DATA MESSAGE FORMAT

Message:

Header Sensor 0 data (optional) S	Sensor 1 data (opt.)		Sensor 15 data (opt.)
---------------------------------------	----------------------	--	-----------------------

- Message length is variable, depending on which sensor data are included. Minimum length is 5 bytes (header only). Maximum length is 5 bytes + all sensor data (see below).
- Integers are big endian: MSB first byte, LSB last byte.

Header:

Version	Device ID	Flags
---------	-----------	-------

- Version: 1 byte; version = 2 for current protocol version.
- Device ID: 2 bytes; 0...65535.
- Flags: 16 bits: flag 15 | flag 14 | ... | flag 0 (LSB).
- The flags indicate, if data of the respective sensors are included in the message or not:
 Flag n == 1: sensor n data included; flag n == 0: not included.

DECODER SOFTWARE

For message decoder software, please go to https://www.decentlab.com/support, where you find code examples in JavaScript and other programming languages.

DETAILS

The message format is described in a table below. The message length depends on the number of levels (length of the probe).

Probe with 6 levels (standard configuration):

One message is transmitted including data of levels 0...5 and the battery voltage (sensor 0 data, sensor 2 data), with the respective flags set to 1: flags = 0x0005.

Probe with 9 or 12 levels:

Two messages are transmitted: message 1 including data of levels 0...5 (sensor 0 data), message 2 including data of levels 6...11 and battery voltage (sensor 1 data, sensor 2 data), with the respective flags set to 1: message 1 flags = 0x0001, message 2 flags = 0x0006.

SENSOR DATA INTERPRETATION

Zero readings (x = 0) indicate that the sensor in the respective depth level is not present. Thus, moisture = -327.68 (x = 0) or temperature = -327.68 (x = 0) or salinity = -100 (x = 0) are not valid data.

Header	FIELD	PARAMETER NAME	TYPE	CONVERSION	UNIT
Header Flags					
Header Flags

DECLARATION OF CONFORMITY

We,

Decentlab GmbH Kriesbachstrasse 30 8600 Dübendorf Switzerland

declare under our own responsibility that the product

Reference Name

DL-SDD-xxx-EU868 Soil Moisture, Temperature and Salinity Profile for LoRaWAN®

to which this declaration refers conforms with the relevant standards or other standards documents

- EN 300 220-1 V3.1.1: 2017-02
- EN 300 220-2 V3.1.1: 2017-02
- EN 301 489-1 V2.2.0: 2017-03
- EN 301 489-3 V2.1.1: 2017-03

According to

- Radio Equipment Directive (RED) 2014/53/EU
- Electromagnetic Compatibility (EMC) Directive 2014/30/EU

Dübendorf, 18. October 2023

Reinhard Bischoff, Managing Director

APPENDIX A: ANTENNA PERFORMANCE

No : **DE.17.039.F01** Page 21 / 24

Measurement Results:

EUT	DLR1-LP8			
Test performed	Effective radiated power (ERP)			
Verdict, Test	Pass			
Modification	None			
Mode of operation	Transmitter mode			
Test date, time	13.06.2018 09:37:06			
Antenna height	1.30 m	Antenna polarization	Vertical	
EUT position	0 to 360 Degree	Antenna distance	3 m	
Measurement settings	Radimation Version: 2017.1.6, RBW: 1 kHz, VBW: 300 kHz, Sweep time: Auto [120 ms], Step freq: Linear: 250 Hz steps, Attenuator: Auto [10 dB], Internal preamp: 20 dB, Measure time: 10 ms, Measurement equipment: TP_RE_30M-1G_ETSI_Ver			

Detected peaks

Peak Number	Frequency	Peak	Peak Difference	Status	Angle	Height	Polarization
1	868.302 MHz	11.9 dBm	-2.14 dB	Pass	157 Degree	1.3 m	Vertical

Limits:

ETSI EN 300 220-2, Table C.1	25 mW e.r.p
OFB: 863 MHz to 870 MHz	
<= 0.1% duty cycle or polite spectrum access	(14 dBm)

EMV Prüfstelle Zürich – Technopark – 8005 Zurich

DISCLAIMER

Specifications and information in this document are subject to change without notice.

Decentlab products are not warranted or authorized for use as critical components in medical, life-saving, or life-sustaining applications, or other applications where a failure would reasonably be expected to cause severe personal injury or death.
